Common And 8d
Box Nails**

Problem 2: A rectangular steel beam is simply supported over a span length 1.8 m and has a cross-section width of $b = 100$ mm and height $h = 200$ mm. It supports a concentrated load $P = 150$ kN at midpoint.

Investigate the principal stresses and maximum shear stresses at cross-section PQ, located at a distance $x = 200$ mm from left support of the

Compared with that of the typical triaxial test, the cohesive force and the increasing internal friction angle increased. Further, as the confining pressure increased, the crescent-like hysteresis loops tapered, shear strength increased linearly, and the modulus of resilience increased nonlinearly; the latter's rate of change, however, decreased.
